

DATA COLLECTION & DATA SOURCE IDENTIFICATION

AI-ML Internship – Task 1 Report

1. Introduction

Data collection is the first and most important step in any AI or ML project. The quality of analysis and model performance depends on the reliability and accuracy of the data used. This task focuses on identifying a suitable dataset and understanding its source and structure.

2. Objective

The main objectives of this task are:

- To identify a relevant dataset for analysis
- To understand different types of data sources
- To perform initial data inspection
- To verify data quality and structure

3. Dataset Identification

Dataset Name: Titanic Dataset

Description: The dataset contains information about passengers aboard the Titanic ship. It includes details such as passenger class, age, gender, fare, and survival status.

Source: Kaggle

Source Link: <https://www.kaggle.com/datasets/yasserh/titanic-dataset>

File Format: CSV

File Name: dataset.csv

Number of Records: 891

Number of Attributes: 12

4. Data Source Identification

- The dataset is obtained from Kaggle, a widely used platform for data science datasets.
- Kaggle datasets are community-contributed and widely used for educational and research purposes.

- The dataset is publicly available and free to use.

5. Data Inspection Summary

- Shape of Dataset: 891 rows and 12 columns
- Data Types: Integer, Float, Object (Categorical)
- Missing Values: Present in columns like Age, Cabin, Embarked
- Duplicate Records: None
- General Observation: The dataset is suitable for exploratory data analysis and building classification models.
